A literature survey shows that three methods are practical for the production of α -oxide rings: (1) direct oxidation of unsaturated compounds by peracids, or in some cases by oxygen in the presence of a catalyst or by hydrogen peroxide in an alkaline medium; (2) hypochlorination of olefins followed by treatment of the resulting halohydrin with an alkali; and (3) condensation of carbonyl compounds with esters of α -chloroacetic acid or with a haloacetophenone to give glycidic esters or ketoxides.
